

Chapter 3 / Example 30 a

Intersecting Graphs

This method uses Geometry to find the intersection points.

Find the points of intersection of the graphs of $f(x) = 4x^2 - 2x - 5$ and $g(x) = 3x + 2$.

Open a new document and add a Graphs page.

The entry line is displayed at the top of the work area.

The default graph type is function, so 'f1(x)= ' is displayed.

The default axes are $-10 \leq x \leq 10$ and $-6.67 \leq y \leq 6.67$.

Type $4x^2 - 2x - 5$ and press **enter**.

The GDC displays the graph $f1(x) = 4x^2 - 2x - 5$ with the default axes.

Press **tab** to display the entry line again. This time 'f2(x)= ' is displayed.

Type $3x + 2$ and press **enter**.

The GDC now displays both graphs:

$$f1(x) = 4x^2 - 2x - 5$$

$$f2(x) = 3x + 2$$

with the default axes.

Chapter 3 / Example 30 a

Intersecting Graphs

To be able to see both intersections you will need to change the window settings

Press **menu** 4:Window/Zoom | 1:Window Settings...

Set the axes to show $-5 \leq x \leq 5$ and $-8 \leq y \leq 12$

You can leave the scales set to Auto.

Press **enter** when you have finished.

Hint: use the **tab** key to move between the windows.

The GDC displays the graphs in a suitable window.

There are two ways to find intersection points. The first is to use **menu** 6:Analyse Graph | 4:Intersection. When there is more than one point, however, the following method is quicker.

Press **menu** 8:Geometry | 1:Points & Lines | 3: Intersection Point(s)

To find the points use the touchpad to highlight the quadratic curve. You will see 'graph f1' displayed.

Click the touchpad.

Use the touchpad to highlight the straight line. You will see 'graph f2' displayed.

Click the touchpad.

The GDC now displays the coordinates of both points of intersection.

The points of intersection are $(2.09, 8.26)$ and $(-0.838, -0.514)$
