

SL & HL Answers to Hess's Law questions

1.

 ΔH^\ominus

(b) By Hess's Law

$$(2 \times -394) + (3 \times -286) = \Delta H^\ominus + (-1560)$$

$$\Delta H^\ominus_f(\text{C}_2\text{H}_6) = -86 \text{ kJ mol}^{-1}$$

2. i.

 ΔH^\ominus

By Hess's Law

$$(4 \times -394) + (5 \times -286) = \Delta H^\ominus + (-2877)$$

$$\Delta H^\ominus_f(\text{C}_4\text{H}_{10}) = -129 \text{ kJ mol}^{-1}$$

ii.

 ΔH^\ominus

By Hess's Law

$$(8 \times -394) + (9 \times -286) = \Delta H^\ominus + (-5470)$$

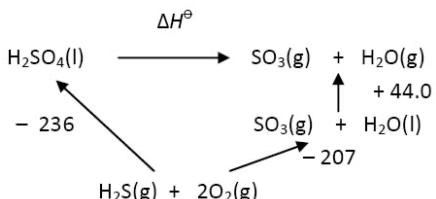

$$\Delta H^\ominus_f(\text{C}_8\text{H}_{18}) = -256 \text{ kJ mol}^{-1}$$

$$\Delta H^\ominus = -236 \text{ kJ}$$

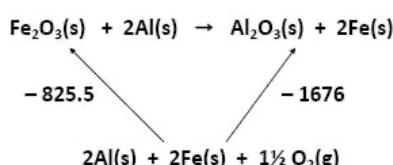

ii.

Subtract (I) from (II) to give $0 = \text{SO}_3\text{(g)} + \text{H}_2\text{O(l)} - \text{H}_2\text{SO}_4\text{(l)}$ $\Delta H^\ominus = -207 - (-236) = +29.0 \text{ kJ}$

Then add (III) and rearrange $\text{H}_2\text{SO}_4\text{(l)} \rightarrow \text{SO}_3\text{(g)} + \text{H}_2\text{O(g)}$ $\Delta H^\ominus = +29.0 + 44.0 = +73.0 \text{ kJ}$

4.

 ΔH^\ominus

By Hess's Law

$$\Delta H^\ominus = -1676 - (-825.5) = -851 \text{ kJ}$$

Amount of aluminium = $20.0 / 26.92 = 0.743 \text{ mol}$

2 mol of Al produce 1 mol of Al_2O_3

20 g of Al produce $0.743/2$ mol of Al_2O_3

Heat evolved by 20 g of Al = $0.743/2 \times 851 = 316 \text{ kJ}$
